

COMPLETED ANSWER EDITION

Day 2

Tasks Workbook

Workflow design, prompt engineering, professional communication, and documentation.

Participant	Details
Name	Mohammed Salim Al-Najjar
Job title	IT Support Specialist
Working context	IT support and software development
Prepared on	13 September 2026

What this file contains

All 12 tasks are answered, with complete CRTFC prompts, example outputs, source-based analysis, and a personal implementation plan. Developer scenarios are included in the role, structured-output, and constraint exercises.

How to read the answers: Prompts, generated examples, and review notes are completed in English. Personal time savings and ratings are worked-example estimates, not measurements from your workplace. Sample scenarios are labelled. A classroom presentation or peer review is not claimed to have taken place.

Source and scope

Based on the supplied **Day2_TasksWorkbook.pdf**, Institute CO{)ELINE by Rihal, AI for Office Automation. Task numbering follows the original workbook. These are reformatted completed answers prepared for the participant; this is not an official answer key.

The separately mentioned Explanation Guide was not attached. Where it is referenced, the answer uses the structure explicitly required in the workbook. Optional personal-data bonuses are omitted because no anonymized work material was supplied.

CRTFC reference

C	R	T	F	C
Context	Role	Task	Format	Constraints

TASK 1 / DESIGN

Design an AI workflow from scratch

Chosen recurring task: Turn raw IT support notes into a clear ticket summary and action list.

Step	My workflow design
INPUT	An anonymized ticket ID, problem description, error message, troubleshooting notes, current status, and any explicitly agreed owner or deadline. Plain text.
PROCESS	Use ChatGPT with a CRTFC prompt. First produce a structured draft; use one follow-up to correct omissions or clarify unknown information.
OUTPUT	A concise ticket summary with checks performed, current status, risks, and an Owner / Action / Deadline table. The support team uses it for handover.
REVIEW	The ticket owner checks every claim against the original notes, removes sensitive information, and confirms owners and deadlines. Target: 3 minutes within a 5-minute assisted workflow.

CRTFC answers

Element	Completed answer
Context	I am an IT support specialist preparing a ticket handover from raw troubleshooting notes.
Role	A senior service-desk analyst writing for the next support engineer.
Task	Summarize the issue, completed checks, current status, and required next actions.
Format	Use Summary, Checks Performed, Current Status, Risks / Unknowns, and an Owner / Action / Deadline table.
Constraints	Maximum 160 words; factual and neutral; use only supplied notes; write Not provided for missing owners or dates; never include passwords or invent a fix.

TASK 1 / PROMPT AND RESULT

Completed prompt and worked output

Combined prompt

Context: I am an IT support specialist preparing a handover. Role: Act as a senior service-desk analyst. Task: Convert the notes below into a useful ticket summary. Format: Summary; Checks Performed; Current Status; Risks / Unknowns; then a table with Owner, Action, Deadline. Constraints: Maximum 160 words. Use only facts in the notes. Mark missing details as Not provided. Do not invent resolution, ownership, or dates. Exclude credentials and personal identifiers.

Notes: Ticket INC-1042. User cannot connect to VPN. Error: authentication failed. Password reset did not resolve issue. Account is active. MFA status not checked. Network team to check VPN logs. No ETA agreed.

Generated worked output

Summary: INC-1042 concerns a VPN connection failure showing an authentication error.
Checks Performed: Password reset attempted without resolving the issue; account confirmed active.
Current Status: Unresolved; VPN log review is required.
Risks / Unknowns: MFA status is not checked. Resolution time is not provided.

Owner	Action	Deadline
Network team	Review VPN logs	Not provided
Not provided	Check MFA status	Not provided

Output rating and improvement

Worked-output rating: 4/5. The draft preserves the source and exposes unknowns. I would add ticket severity, user impact, and the next update time to the input template. These should be supplied by the ticket owner, not guessed by AI.

TASK 2

My top five automation opportunities

Planning estimates per occurrence, including human review in the assisted time. Frequencies below are assumptions for a pilot.

Task	Manual	With AI	Saved	Ease /5	Top 3?
Ticket summaries	15 min	5 min	10 min	5	Yes
Routine support emails	12 min	4 min	8 min	4	Yes
Meeting minutes	30 min	10 min	20 min	5	Yes
Weekly support report	60 min	20 min	40 min	4	No
First-pass code review	30 min	20 min	10 min	3	No

Top automation opportunity

Ticket summaries are my first priority because they recur frequently and follow a predictable structure. The ideal output is a short, accurate handover that shows what happened, what was checked, and what needs to happen next. At 20 summaries per week, the estimated saving is 200 minutes per week.

Context AI would need

The approved ticket template, priority definitions, anonymized notes, completed checks, team ownership rules, escalation rules, and any agreed service deadline. It also needs a rule that unknown information stays unknown.

Weekly prioritization

Task	Assumed frequency	Estimated weekly saving
Ticket summaries	20 per week	200 min
Support emails	10 per week	80 min
Meeting minutes	3 per week	60 min
Weekly report	1 per week	40 min
First-pass code review	3 per week	30 min

Top-three total: 340 minutes, or 5 hours 40 minutes per week. All five: 410 minutes, or 6 hours 50 minutes. These are separate task estimates; a pilot must check for overlap and actual savings.

TASK 3

Role upgrade: four weak roles

Weak role	Strong role rewrite	What I added
You are a writer.	Act as a senior IT communications writer preparing clear service updates for non-technical employees.	Seniority; IT communications; employee audience.
You are a developer.	Act as a senior Java and Spring Boot reviewer explaining REST API issues to a junior backend developer.	Seniority; Java / REST domain; junior audience.
You are an expert.	Act as a senior data-quality analyst reviewing sales data for an operations manager who needs reliable decisions.	Seniority; data quality; decision-maker audience.
You are helpful.	Act as an experienced service-desk trainer giving practical troubleshooting guidance to newly hired IT support staff.	Experience; service desk; new staff.

Comparison using the same task

Task: Explain why a Spring Boot endpoint might return HTTP 400 when a student is added.

Role version	Illustrative output
Weak: You are a developer.	Check the request data and fix invalid input.
Strong: senior Java reviewer for a junior developer	A 400 response can indicate invalid request input. Compare the JSON field names and types with the request DTO, inspect validation messages, and check Content-Type. The exact cause needs the request and server error details.

Reflection and rating

Biggest impact: audience. Naming a junior developer encouraged clear checks and explained what to inspect. Domain made the checks relevant. Seniority alone would not guarantee correctness.

Worked-comparison rating: 4/5. The stronger role is more actionable and avoids pretending to know the exact cause.

TASK 4 / SCENARIO B

Build a structured-output prompt

Selected scenario: B - Python code review. The function is intended to accept a non-empty list of finite numeric scores.

```
def average_score(scores):  
    return sum(scores) / len(scores)
```

Element	Completed answer
Context	I am reviewing a small Python helper before using it in a score-reporting service.
Role	A senior Python reviewer explaining issues to a junior developer.
Task	Review the supplied average_score function against its intended input contract.
Format	A numbered list of at most three issues. Each issue must contain Severity (H/M/L), Description, and Suggested Fix.
Constraints	Maximum 180 words. Report only demonstrable issues. Do not rewrite the application or invent surrounding code. Flag unknown requirements.

Combined prompt and exact specification

Act as a senior Python reviewer for a junior developer. Review the supplied average_score(scores) function, which should accept a non-empty list of finite numbers and return their average. Return at most three numbered issues, each with exactly these labels: Severity: H/M/L; Description:; Suggested Fix:. Keep the report under 180 words. Report only issues demonstrated by this code or its stated contract. Do not assume a web framework. State uncertainty when surrounding behavior is unknown. Code: def average_score(scores): return sum(scores) / len(scores).

Format type: Numbered list. **Fields:** Severity, Description, Suggested Fix. **Quantity:** Up to three issues. **Length:** Under 180 words.

TASK 4 / OUTPUT

Structured review and refinement

Generated report

1. Severity: M

Description: An empty list causes division by zero instead of a useful validation error.

Suggested Fix: Reject an empty list with ValueError before calculating the average.

2. Severity: M

Description: The function does not validate its numeric input contract. Strings or None can cause a TypeError; non-finite numbers can produce an unusable average.

Suggested Fix: Validate each value as a finite number and define whether booleans are acceptable.

3. Severity: L

Description: The expected input and error behavior are undocumented, making correct use less clear.

Suggested Fix: Add a docstring describing accepted inputs, return value, and validation errors.

Follow-up turn

Keep the same numbered structure and word limit. Add one concrete verification example inside each Suggested Fix. Reject booleans explicitly. Do not add new issue fields or unrelated refactoring.

Refined verification details

Issue	Verification example added to Suggested Fix
1	average_score([]) raises ValueError.
2	[10, 20] returns 15.0; [10, None], [True, 20], and [float("inf")] are rejected with a clear validation error.
3	The docstring states that input is a non-empty list of finite numbers, excludes booleans, and documents the chosen exception type.

Specification match: 5/5. Three numbered issues, valid severity values, all required labels, and fewer than 180 words in the original generated report. This reviews the stated contract; it does not establish the behavior of a larger application.

TASK 5

Constraint engineering practice

1. Weak prompt: Summarize this meeting.

Missing constraints: length, sections, handling of unknown owners or dates, factual grounding, and tone.

Summarize the supplied meeting notes in no more than 150 words. Use Decisions, Actions, and Open Questions. Format Actions as Owner | Task | Deadline. Use a neutral professional tone and only facts stated in the notes. Mark unknown details as Not provided. Flag conflicts rather than resolving them by guessing.

2. Weak prompt: Write a report about our Q3 performance.

Missing constraints: sources, audience, word limit, structure, and unsupported-causation rules.

Using only the two supplied Q3 documents, write a report for the management team under 250 words. Start with one recommendation, then use Key Metrics, Risks, and Next Steps. Cite each factual claim as [D1] or [D2]. Preserve numbers exactly. Label recommendations as proposals. Identify missing evidence and do not invent targets, costs, or causes.

3. Weak prompt: Review this code and fix any issues.

Missing constraints: scope, compatibility, issue priority, verification, and uncertainty handling.

Review only the supplied average_score function. Preserve its name and valid numeric-input behavior. Identify at most three issues, ordered by severity, and provide a minimal corrected function plus meaningful examples for valid and invalid input. Use the Python standard library only. State assumptions about types; do not claim tests were run unless execution results are available.

Worked evaluation

Using the Task 8 notes, the meeting prompt preserves Omar as the escalation owner and Monday as the stated day. Using Task 9, the report attributes 87 responses to D1 and 42 story points to D2. For Task 4 code, an empty-list guard addresses a demonstrated failure. These constraints produce more checkable outputs.

Biggest impact: source-only grounding plus explicit unknown handling. **Rating: 4/5.** A strict format helps review, but it does not by itself guarantee accuracy.

TASK 6 / REPLY STRATEGY

Email chain: communicate a delay

Exercise assumption: The original deadline is Friday, 20 September 2024. Treat the stated delay as five calendar days, so the revised target is Wednesday, 25 September 2024. The real deadline and whether the delay means calendar or working days must be confirmed before sending. These dates are illustrative.

Element	Completed answer
Context	As the project coordinator, I must reply to Sarah, whose board presentation depends on our first deliverable. Ahmed reports a five-day delay caused by a data dependency.
Role	An experienced project manager handling a client update with accountability and tact.
Task	Acknowledge the delay, explain its effect, give the assumed revised date, and offer help rescheduling the board presentation.
Format	Subject line, greeting, three short paragraphs, and a professional closing.
Constraints	Under 160 words per email; no blame or internal quotes; no invented progress; do not imply authority to change the client board schedule; make the target date clear.

Full email prompt

Act as an experienced project manager. Sarah expected the first deliverable by the end of this week and scheduled a board presentation around it. My manager reports a five-day delay due to a data dependency. For this exercise only, assume the original deadline is 20 September 2024 and the delay is five calendar days, making the revised target 25 September 2024. Draft a professional reply that apologizes, acknowledges the board impact, states the revised target, and offers to help coordinate a revised presentation date if Sarah wants. Use a subject line, greeting, short paragraphs, and closing. Stay under 160 words. Take responsibility without blaming another team. Do not invent completion percentages or guarantees. Then give formal and direct tone alternatives with the same facts.

TASK 6 / EMAIL OUTPUTS

Three versions of the client reply

Professional version

Subject: Updated delivery timeline

Hi Sarah,

I am sorry, but our first deliverable will be delayed by five calendar days because a required data dependency is still outstanding. Our revised target is Wednesday, 25 September.

I recognize that your team scheduled a board presentation around the original date, and I apologize for the disruption. If you need to move the presentation, I can help coordinate a revised date that works for your team.

Please let me know your preferred next step.

Kind regards,
Mohammed

Formal alternative

Subject: Revised target for the first deliverable

Dear Sarah,

Please accept my apologies for a five-calendar-day delay to the first deliverable due to an outstanding data dependency. The revised target is Wednesday, 25 September.

We understand the impact on your planned board presentation. If a revised presentation date is required, I would be pleased to assist with coordination, subject to your team's availability.

Yours sincerely,
Mohammed

Direct alternative

Subject: First deliverable delayed by five days

Hi Sarah,

The first deliverable will be five calendar days late because a required data dependency is outstanding. The new target is Wednesday, 25 September. I am sorry for the disruption to your board presentation.

Would you like help coordinating a revised presentation date?

Regards,
Mohammed

Rating: 4/5. Clear, accountable, and concise. **Before sending:** confirm the original date, calendar versus working days, revised target, and any interim material available. The email remains a draft.

TASK 7 / SCENARIO B

Executive memo: adopt TypeScript

Element	Completed answer
Context	Our team proposes TypeScript for new services instead of JavaScript: three months, with upskilling risk.
Role	An engineering lead advising the CTO.
Task	Recommend approval and explain benefits, risks, and implementation steps.
Format	TO / FROM / DATE / SUBJECT; Recommendation; Rationale with 3-4 bullets; Risks; Next Steps table with Action / Owner / Deadline.
Constraints	Under 300 words; recommendation first after the header; no invented ROI or guaranteed defect reduction; proposed owners and milestones labelled.

Combined prompt

As an engineering lead, recommend TypeScript for new services to the CTO. Use type safety, fewer runtime errors, a three-month transition, and upskilling risk. Format: TO / FROM / DATE / SUBJECT; Recommendation first; three Rationale bullets; Risks; Next Steps table (Action / Owner / Deadline). Stay under 300 words. Label owners and milestones as proposed. Do not invent ROI or promise to eliminate runtime errors.

Generated executive memo

TO: CTO
FROM: Engineering Lead
DATE: 13 September 2026
SUBJECT: TypeScript for new services

Recommendation: Approve a three-month phased adoption of TypeScript for new services, beginning with one pilot.

Rationale

- Type checking can catch incompatible values before execution.
- Clearer interfaces make service contracts easier to understand.
- Earlier detection of type-related mistakes can reduce some runtime errors.

Risks: Team upskilling may slow initial delivery. Pairing, focused training, and a pilot will help. Runtime input validation and automated tests are still needed.

Action (proposed)	Owner (proposed)	Deadline
Define standards and training	Engineering lead	Month 1
Build and review one pilot	Service team	Month 2
Extend to new services after review	Engineering lead	Month 3

All checks: Yes. Recommendation first; header; three rationale bullets; next-steps table; under 300 words; appropriate language. **Rating: 4/5.** No extra turn needed.

TASK 8 / MINUTES

Meeting minutes and action tracking

Meeting-minutes prompt

Act as a project coordinator. Turn the supplied sprint-planning notes into minutes with Meeting Details, Discussion, Decisions, an Action / Owner / Deadline table, and Open Questions. Preserve names and the 70% API progress figure. State Nov 30 as the agreed ship date. Date is Monday; year and calendar date are not given. Do not infer them. Distinguish agreed actions from proposed follow-up. Preserve the conditional three-day delay risk and flag deadlines or owners that are not stated.

Completed minutes

Meeting: Sprint Planning. **Date:** Monday; exact date and year not provided.
Attendees: Ali (PM), Reem (Dev Lead), Omar (Backend), Fatima (QA), Nour (Design).
Discussion: Q4 sprint goals and the payment module. Backend API work is 70% complete. OAuth configuration awaits security approval. If unresolved by Wednesday, Omar estimates a three-day delay. QA raised late involvement and late bug discovery. UI mockups were approved with one checkout revision required.
Decisions: Ship the payment module on November 30. Include QA in sprint planning. Omar escalates the OAuth issue to the security team today. The checkout revision is still required.

Action	Owner	Deadline / status
Escalate OAuth configuration approval	Omar	Today (Monday); agreed
Provide security sign-off	Security team	Not agreed; Wednesday is the risk checkpoint
Revise checkout flow	Not explicitly assigned; Nour proposed	Not provided
Include QA in sprint planning	Not explicitly assigned; Ali proposed to coordinate	From next sprint planning

Next meeting: Wednesday standup to review the OAuth blocker.
Open questions: Confirm exact dates and year, owner and deadline for the checkout revision, and security sign-off timing. The delay is a risk, not an already-confirmed change to the November 30 commitment.

TASK 8 / AUDIENCE ADAPTATION

One meeting, two audiences

Audience 1: CEO

Prompt instruction: Rewrite the minutes as exactly 100 words for a non-technical CEO. Focus on the delivery commitment, approval risk, quality process, and next checkpoint. Keep the conditional delay and do not invent dates or commitments.

The payment module remains scheduled for November 30. Backend work is 70% complete, but a required security approval is outstanding. If this is not resolved by Wednesday, the team estimates a three-day delay. Omar will escalate the approval request today. The team agreed to include quality assurance in sprint planning to address concerns about defects being discovered late. Updated interface designs were approved, with one checkout revision still required. The next checkpoint is Wednesday's standup. Management should monitor the approval dependency and confirm ownership and timing for the checkout revision. The meeting's exact calendar date and year were not provided.

Audience 2: engineering team

Prompt instruction: Write a technical, action-focused version. Preserve OAuth, backend progress, owners, decisions, unresolved details, and dependencies. Separate agreed work from proposed follow-up.

Delivery: Payment module target is Nov 30. Backend API is 70% complete.

Blocker: Security sign-off on OAuth configuration is pending. Omar escalates Monday. Unresolved status by Wednesday risks an estimated three-day delay.

Process: QA will join sprint planning. Coordination owner is not explicitly assigned.

Design: UI mockups approved; checkout needs one revision. Confirm ownership and deadline with Nour.

Checkpoint: Wednesday standup. Confirm sign-off status, checkout revision, and any effect on the Nov 30 target.

Comparison and review

The CEO version required more editing because technical details had to be translated into delivery impact while meeting the 100-word requirement. The engineering version keeps OAuth terminology and separates dependencies from actions. Both preserve the same underlying facts.

Worked-output rating: 4/5. The exact meeting date and some ownership details still need confirmation.

TASK 9 / SYNTHESIS

Multi-document analysis

Source key: [D1] Q3 Customer Feedback Survey Summary. [D2] Q3 Engineering Performance Report. Both are printed in the original Task 9.

Multi-document prompt

Act as a senior operations analyst. Analyze the supplied D1 customer survey and D2 engineering report for management. Return: an Executive Summary under 100 words; a Key Themes table with Theme, D1 Evidence, D2 Evidence, and Implication; then exactly three ranked insights, each with source citations and one proposed action. Use only these documents. Cite factual claims as [D1] and/or [D2]. Distinguish correlation from causation, avoid converting theme mentions into exclusive customer groups, and explicitly state conflicts or evidence gaps.

Executive summary

Prioritize report performance and mobile reliability for investigation. Customers report slow report generation (41 mentions), missing bulk export (38), and mobile crashes (27); satisfaction is 3.6/5 and NPS is +12. [D1] Engineering reports one engineer and three open bugs in the reporting module, plus high-risk mobile technical debt. [D2] These findings align as priorities but do not establish root causes. Payment delivery and the security audit were positive achievements, while earlier QA involvement reportedly reduced late-stage bug discovery by 30%. [D2]

Theme	D1 evidence	D2 evidence	Implication
Reporting speed	41 negative mentions; dashboard takes 8-10 seconds	1 engineer; 3 open reporting bugs; module last updated 4 months ago	Investigate report and dashboard performance separately; assess capacity.
Bulk export	38 mentions of missing feature	No export evidence supplied	Validate requirements before scheduling work.
Mobile reliability	27 crash mentions	Codebase high risk; major refactor 18 months ago	Investigate crashes and prioritize fixes.
Delivery and quality	Support praised 28 times	42 vs 50 target points; 3/4 sprints on time; QA metric improved 30%	Keep effective practices; examine delivery gaps.

TASK 9 / INSIGHTS AND EVALUATION

Three insights with traceable evidence

Rank	Insight and evidence	Proposed action
1	Reporting performance deserves attention: 41 customer mentions [D1] align with one engineer and three open reporting bugs [D2]. This is an association, not proof of cause.	Profile report generation and dashboard loading; review reporting capacity.
2	Mobile reliability is a shared concern: 27 crash mentions [D1] accompany a high-risk codebase and an 18-month gap since the last major refactor [D2].	Review crash logs and prioritize high-impact fixes before selecting refactoring scope.
3	Early QA involvement is worth preserving: D2 reports 30% less late-stage bug discovery, while customers still report failures [D1]. The measure is not a 30% reduction in all bugs.	Retain early QA and track production defects alongside the existing metric.

Results evaluation

Check	Result	Notes
Executive Summary	Yes	Summarizes cross-source priorities.
Key Themes table	Yes	Four themes; missing evidence explicit.
Sources for each insight	Yes	All three insights identify D1 and/or D2.
Conflicts identified	Yes / no direct contradiction	Different scopes; no explicit contradictory fact found. Root causes and export feasibility are unknown.
Requested format	Yes	Summary, themes, three insights, evaluation.

Prompt improvement

Require every theme to show evidence from each document or the label No evidence supplied. Require a separate Evidence Gap column and state whether a link is a fact or an interpretation. This reduces unsupported merging of dashboard speed with report-generation defects.

TASK 10 / PROMPT AND LONG VERSION

Executive summary: 200-word limit

Element	Completed answer
Context	Management needs a short decision brief combining the Task 9 customer and engineering documents.
Role	An executive communications analyst.
Task	Summarize the Q3 evidence and recommend next actions.
Format	Recommendation; Key Findings; Risks / Evidence Gaps; Next Steps.
Constraints	At most 200 words, then at most 100. Recommendation first. No new factual information. Clearly label proposed actions; retain citations.

200-word prompt

Using only D1 and D2 from Task 9, act as an executive communications analyst and produce a management summary of no more than 200 words. Use Recommendation, Key Findings, Risks / Evidence Gaps, and Next Steps in that order. Put the recommendation first. Cite the supporting document for each factual claim. Keep source figures unchanged and label actions as proposals. Do not invent costs, owners, root causes, or forecasts.

Generated version - within 200 words

Recommendation: Prioritize investigation of report performance and mobile reliability while validating demand for bulk export.

Key Findings: Among 87 survey responses, satisfaction was 3.6/5 and NPS was +12. Customers mentioned slow report generation 41 times, missing bulk export 38 times, and mobile crashes 27 times. Dashboard loading reportedly takes 8-10 seconds. [D1] Engineering reports one reporting engineer, three open reporting bugs, and a high-risk mobile codebase. Velocity averaged 42 points against a 50-point target; three of four sprints were on time. Payment integration launched two weeks early, the security audit had no critical findings, and earlier QA involvement reportedly reduced late-stage bug discovery by 30%. [D2]

Risks / Evidence Gaps: The documents do not establish crash causes or prove that staffing explains slow reports. Dashboard and reporting issues may differ. Export effort is unknown.

Next Steps: Profile performance, investigate crashes, assess reporting capacity, and clarify export requirements. Retain early QA involvement and measure whether fixes improve customer experience. These actions are proposals. None is an already-approved commitment.

TASK 10 / SHORTER VERSION AND COMPARISON

Executive summary: 100-word limit

Follow-up prompt

Condense the previous summary to at most 100 words, retaining the same four headings, recommendation-first structure, accurate citations, main risks, and proposed next steps. Remove secondary details before removing the evidence that supports the recommendation.

Recommendation: Prioritize report-performance and mobile-reliability investigations.

Key Findings: Survey respondents cited slow reports 41 times, missing bulk export 38 times, and mobile crashes 27 times; satisfaction was 3.6/5. [D1] Reporting has one engineer and three open bugs; mobile code carries high-risk technical debt. Earlier QA involvement reportedly reduced late-stage bug discovery by 30%. [D2]

Risks / Evidence Gaps: Root causes and export effort are unknown.

Next Steps: Profile performance, investigate crashes, assess reporting capacity, validate export requirements, and retain early QA. These are proposed actions.

Review item	200-word limit	100-word limit
Recommendation location	First	First
New factual information	No	No
Most useful section	Key Findings: fuller decision context	Next Steps: fast prioritization
What changes	Keeps survey size, NPS, velocity, delivery achievements, and evidence gaps	Keeps the main complaint counts, capacity concern, QA measure, and actions
Best use	A management pre-read	An email briefing or quick update

Which is more useful?

The 200-word limit is more useful for a decision meeting because it balances risks with delivery achievements. The 100-word version is better for a quick update. Both keep the recommendation first and separate source facts from proposals.

TASK 11 / PROMPT

Turn the Q3 report into eight slides

Element	Completed answer
Context	The combined Q3 report from Tasks 9-10 must become an executive discussion.
Role	A presentation strategist and executive communications specialist.
Task	Create an eight-slide outline that supports prioritization of performance, reliability, and export discovery.
Format	Table: Slide, Title + slide text, Flow Stage, Under 30 Words?, Speaker Notes?.
Constraints	At most 30 words per slide, including title. Flow: Hook, Context, Problem, Problem, Solution, Solution, Evidence, CTA. Notes for slides 3 and 5 are separate. No invented facts.

Report-to-presentation prompt

Act as an executive presentation strategist. Convert the supplied Q3 customer and engineering findings into eight slides for the management team. The goal is to request agreement on the next investigation priorities. Use the flow Hook, Context, Problem, Problem, Solution, Solution, Evidence, CTA. Each slide must contain a title and concise text totalling no more than 30 words. Keep facts traceable to D1 or D2. Label solutions as proposals. Provide separate speaker notes for slides 3 and 5; these do not count toward slide text. Do not invent funding, owners, forecasts, or approved commitments.

Speaker notes - slide 3

D1 records 41 mentions of slow report generation and a separate dashboard load-time complaint of 8-10 seconds. D2 describes one reporting engineer and three open bugs. These facts justify investigation; they do not prove staffing or bugs caused every delay. Ask for performance measurements and a capacity review.

Speaker notes - slide 5

The proposed response is to measure before choosing fixes: profile report generation, measure dashboard loading separately, and investigate mobile crashes. Scope work using evidence, then track whether customer experience improves. No budget, delivery commitment, or expected percentage improvement is stated in the sources.

TASK 11 / COMPLETED OUTLINE

Presentation outline and evaluation

Slide	Title and slide text	Flow	<30?	Notes?
1	Protect the Customer Experience Satisfaction is 3.6/5. Focus next on the issues customers repeatedly report. [D1]	Hook	Yes	No
2	Q3 Context 87 survey responses; 42 average story points against a 50-point target. [D1, D2]	Context	Yes	No
3	Reporting Performance Slow reports received 41 mentions. Reporting has one engineer and three open bugs. Investigate the connection. [D1, D2]	Problem	Yes	Yes
4	Reliability and Feature Gaps Mobile crashes received 27 mentions; bulk export was requested 38 times. Mobile code is high risk. [D1, D2]	Problem	Yes	No
5	Proposed: Measure and Stabilize Profile reporting and dashboard performance, investigate mobile crashes, and prioritize fixes using evidence.	Solution	Yes	Yes
6	Proposed: Shape the Backlog Review reporting capacity, clarify export requirements, and retain early QA participation before committing scope.	Solution	Yes	No
7	Build on Q3 Evidence Payment integration launched two weeks early; security audit found zero critical issues; late-stage bug discovery fell 30% after earlier QA involvement. [D2]	Evidence	Yes	No
8	Agree the Next Steps Endorse the investigation priorities; confirm owners, success measures, and a review date before approving delivery commitments.	CTA	Yes	No

Rating: 4/5. Slide 8 needed the most editing: its call to action had to request a decision without inventing a budget or approval. The final version asks management to confirm ownership, measures, and review timing. Every slide is below 30 words including its title.

TASK 12 / IMPLEMENTATION PLAN

My Day 2 personal AI workflow plan

Task / deliverable	Day 2 skill	Template	Saved / week	Top 3?
Ticket summaries	IPO workflow + constraints	Task 1 support handover	200 min	Yes
Support emails	Role + tone adaptation	Task 6 client update	80 min	Yes
Meeting minutes	Structured output + audience	Task 8 minutes	60 min	Yes
Weekly support report	Multi-document synthesis	Tasks 9-10 summary	40 min	No
First-pass code review	Role + constraints	Tasks 4-5 review	30 min	No

Estimates use the same frequencies and per-task savings as Task 2. They include review time and assume each task is distinct.

My 60-second pitch

I will use AI to turn anonymized support notes into structured ticket summaries. I will use an Input, Process, Output workflow and a CRTFC prompt that defines the role, required sections, and factual limits. The AI will draft the issue, checks performed, current status, and next actions. I will review each result before adding it to the ticket. My initial target is to reduce one summary from 15 minutes to 5 minutes. At 20 summaries per week, that could save about 3 hours and 20 minutes. I will begin with a small pilot, record editing time and errors, and improve the template before expanding to emails and meeting minutes.

First-week implementation

1. Prepare an anonymized note template and agree the output format.
2. Try it on five sample or approved anonymized tickets.
3. Compare each draft with its notes; measure total drafting plus review time.
4. Fix repeated omissions in the prompt.
5. Expand only when accuracy and actual time savings justify it.

TASK 12 / REFLECTION

Day 2 final reflection

Q1. Which task will save me the most time?

Ticket summaries offer the largest estimated weekly saving because of their frequency: 20 summaries multiplied by 10 minutes saved equals 200 minutes per week.

Q2. What was the most surprising result?

In the worked examples, a clear output structure and an instruction to expose missing details made the answer more useful than simply asking AI to write professionally.

Q3. Which technique was hardest to master?

Constraint prompting was the hardest. Too few constraints allow vague answers, while too many can make the output crowded. I would focus first on source grounding, required fields, audience, and a sensible length limit.

Q4. What will I implement first this week?

A manual ticket-summary workflow using anonymized notes, the Task 1 prompt, and human approval. I would connect it to a ticketing system only after confirming quality and access requirements.

Q5. What question do I still have?

How can I connect an approved AI drafting step to our ticketing system while keeping access controlled, recording edits, and ensuring that no response is sent without the responsible person reviewing it?

Completion note: All 12 written tasks are answered. Ratings and reflections are suggested personal responses based on the worked outputs. Adjust them to reflect your own experience before presenting them as a classroom reflection.
